Deployment Summary for SendGuard

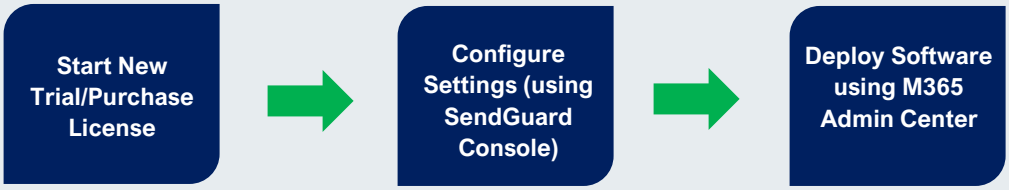

SendGuard can be **quickly configured and deployed to** users. SendGuard can also be **locked down so that users are unable to change settings**.

There are two main versions of SendGuard depending on the environment (New Outlook/Classic Outlook for Windows Desktop, OWA or Outlook for Mac.)

The deployment methods for the two versions are summarized below. Detailed Deployment Guides are also available for Partners and Administrators.

M365 Addin (New Outlook, OWA, Outlook for Mac and Outlook Classic)

SendGuard is deployed using the **Microsoft Admin Center**. Settings can be configured and pushed out using the **Standss SendGuard Management Console** once you have a trial or full license. License information is created as soon as the trial starts.

Please note that app propagation may take up to 72 hours due to Microsoft limitations.

For further information, please refer to the SendGuardM365 User Guide.

COM-Addin (Outlook Classic only)

The easiest method for deployment is using a **Customized MSI** which already contains the users license information and settings.

Other Supported Deployment Methods

- We can provide **ADMX/ADML** files for deployment/updates using GPO.
- SCCM, msiexec, **Intune** or any other installation/packing too. (Intune deployment propagation may take up to **8 hours** for all users and devices.)

For further information, please refer to the SendGuard COM Add-In User Guide

Detailed Deployment Guides are also available for Partners and Administrators.
